

# Nutritional Challenges and Enteral Supplementation Strategies Across the CKD Spectrum

2018 ASPN MULTIDISCIPLINARY SYMPOSIUM

Kristen Sgambat, Ph.D., RD

Asha Moudgil, MD, FASN, FAST

## Learning Objectives

- A case-based interactive review of nutritional challenges across the spectrum of CKD, PD, and after transplantation.
- Nutritional interventions and solutions.
- To have a basic understanding of nutritional management across the entire CKD spectrum.

## Goals of Nutrition Therapy

- Maintain adequate intake of macro and micronutrients
- Avoid uremic toxicity, metabolic imbalances, and renal bone disease
- Optimize growth and development
- Reduce risk of chronic morbidities and mortality in adulthood

## CKD: Impact on All Organs

Bones can break, muscles can atrophy, glands can loaf, even the brain can go to sleep, and not endanger our survival, but should the kidneys fail in their task neither bone, muscle, gland nor brain could carry on.

From Dr. Homer W. Smith: Fish to Philosopher

## Unique Aspects & Impact on Nutrition

### CAKUT

- Polyuria, excessive thirst
- Salt wasting
- Decreased protein synthesis due to salt-wasting\*

### GLOMERULAR

- Fluid and salt overload
- Hypertension
- Protein loss
- Dyslipidemia

- Metabolic acidosis: Decreased IGF-1 and GH receptors. Increased steroid production & protein degradation
- GH resistance

\*Parekh et al. JASN 2001;12:2418-2426    \*\*Rodig et al. Pediatr Nephrol (2014) 29:1987-1995

## Altered Body Composition

- Lean mass deficit and increase in fat mass
- Impaired growth, short stature with altered trunk: limb ratio
- Increased Waist to Height Ratio
- Growth hormone resistance and decreased exercise capacity may be responsible for increased WHr

Silverstein D. Growth and Nutrition in Pediatric CKD. Front. Pediatr., 14 August  
Rashid et al. Pediatr Nephrol 21:1730-1738, 2006

## Causes of Malnutrition in CKD/ESRD

### Altered taste sensitivity

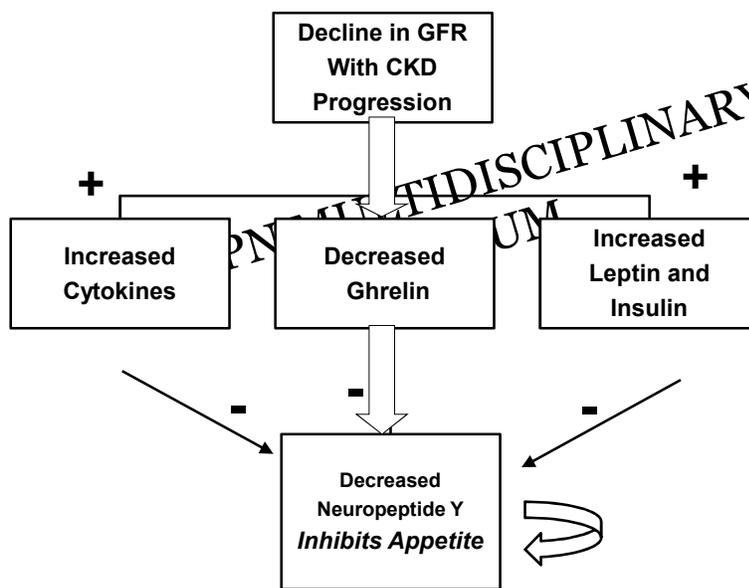

- Micronutrient deficiencies (Zinc)
- Decreased # of taste buds\*

### Anorexia and poor growth

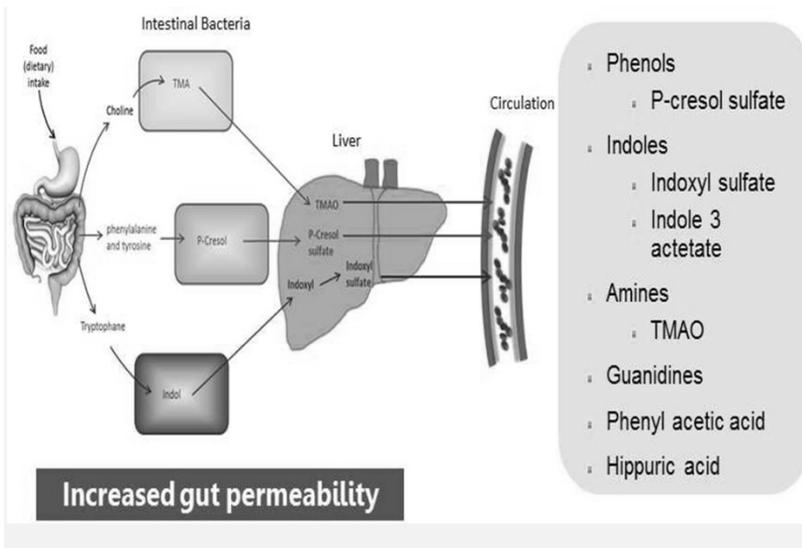

- Unpalatable prescribed diet and binder regimens
- Alterations in hormonal and neuropeptide signaling
- Altered microbiome with uremic toxins
- Renal osteodystrophy: adynamic bone disease or hyperparathyroidism; destruction of growth plate, epiphyseal displacement, metaphyseal fractures

\*Correa et al. Reduced taste function and taste papillae density in children with chronic kidney disease. *Pediatr Nephrol* (2015) 30:2003–2010.

## Neuropeptide Alterations and Appetite

## Altered Microbiome in CKD

Nallu, et al. Gut microbiome in chronic kidney disease: challenges and opportunities. *Transl Res.* 2017 Jan;179:24-37.

## Impact of Dialysis on Nutrition

### Hemodialysis-specific

- Stricter fluid and electrolyte limits pose significant challenges in younger anuric children
- Carnitine deficiency
- Negative protein balance at the end of HD
- Chronic inflammation, oxidative stress

### PD-specific

- Delayed gastric motility, GER, and vomiting
- Early satiety
- Increased protein losses and glucose absorption

Nelms C. Optimizing Enteral Nutrition for Growth in Pediatric CKD. *Front. Pediatr.*, 02 August 2018

## Defining Malnutrition

- Defined as Wt/Ht or BMI  $\leq$  -1 SDS\*
  - 1 to -1.9      **mild**
  - <-2 to -2.9    **moderate**
  - $\leq$ -3            **severe**
- Height/age  $\leq$  -3 SDS, consider non-nutritional factors
- Other parameters:
  - Nutritional intake
  - Rate of weight gain or loss
  - Growth velocity
  - Mid-upper arm circumference
  - *WHR*\*\*
  - *Trunk to limb ratio*

\*Becker, P., *Consensus statement of the AND/ASPEN*. Nutr Clin Pract, 2015. **30**(1): p. 147-61.

\*\*Sgambat, Moudgil et al. Waist-to-height ratio, body mass index, and cardiovascular risk profile in children with chronic kidney disease. *Pediatr Nephrol*. 2018 .

## Malnutrition and PEW

**Malnutrition:** “An imbalance between nutrient requirement and intake, resulting in cumulative deficits of energy, protein and micronutrients negatively affecting growth, development and other health outcomes”

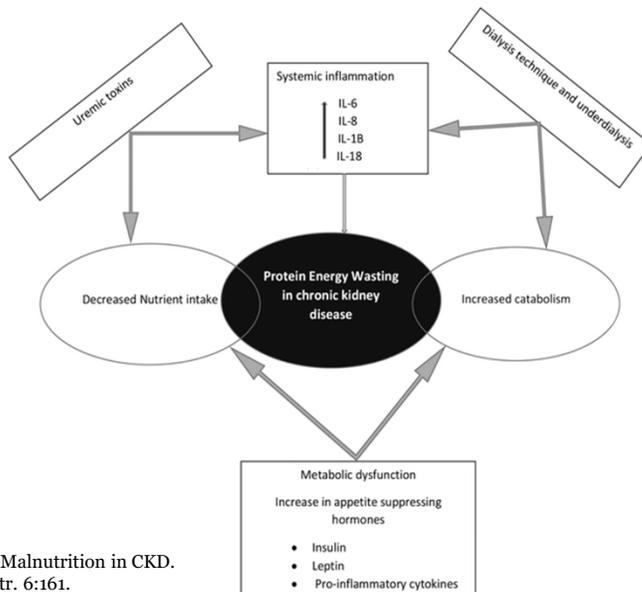

Mehta et al. Defining Pediatric Malnutrition. *JPEN Volume 37*, Issue 4, July 2013, p 460-481

**Protein Energy Malnutrition:** state of decreased body stores of protein and energy fuels

**Protein Energy Wasting:** Refers to multiple nutritional and catabolic alterations occurring in CKD which can't be corrected by increasing energy intake

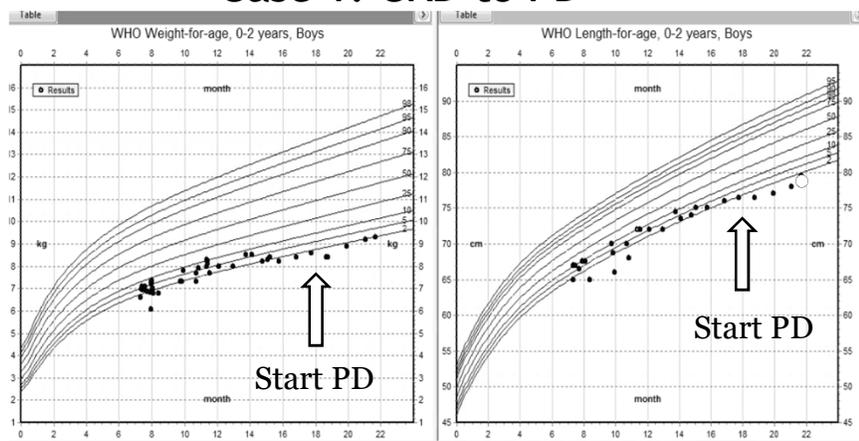

Fouque D et al. A proposed nomenclature and diagnostic criteria for protein-energy wasting in acute and chronic kidney disease. *Kidney Int.* (2008) 73:391–8.

# Protein Energy Wasting in Dialysis

Iorember F. Malnutrition in CKD. Front. Pediatr. 6:161.

## Case 1: CKD to PD

- Male with CKD at 8 months sec. to PUV
- Started PD at 18 months, G-tube not placed
- Loss of appetite, decreased formula intake, stopped eating food
- Vomiting
- Decline in weight gain and growth velocity

## What will you do first?

- B.** Higher calorie containing oral formula  
**C.** Appetite stimulants  
**D.** Growth Hormone  
**E.** Pro-motility agent  
**F.** NG tube feeding  
**G.** G-tube feeding  
**H.** GJ-tube feeding  
**I.** Change to HD

## Nutritional Options: Oral

- High caloric strength formulas and protein bars/powders
- High calorie and protein diet

### *Advantages:*

- No need for surgery

### *Disadvantages:*

- Expensive and inability to afford
- Unacceptable taste
- Non-adherence
- In children on PD <2 years, BMI decreased with oral feeding and increased with NG/GT feeding\*

\*Rees et al: JASN 2011; 22: 2303-2312

Formula Options			
Formula	Age Group	Caloric Concentration	Features
Similac PM 60/40 Or breastmilk	Infant	20 kcal/oz	Low lytes
Renastart	Pediatric	30 kcal/oz	Very low protein, very low lytes
Novasource Renal (or Nepro)	Adolescent/Adult	60 kcal/oz (54 kcal/oz)	High Protein, low Lytes
Suplena	Adolescent/Adult	54 kcal/oz	Moderate Protein, low Lytes
Renalcal	Adolescent/Adult	60 kcal/oz Enteral only	Low protein, Electrolyte Free
Ensure Clear	Pediatric/Adult	30 kcal/oz	Clear Liquid, no K or Phos
Blenderized diet	Custom designed recipe to meet nutrient needs via Gtube Limitations- bolus only, food safety, labor intensive		

## Pharmacologic Therapies

### CURRENT

- Pro-motility agents
- Appetite stimulants
  - Megestrol acetate
  - Cyproheptadine

### FUTURE

- Ghrelin: Appetite stimulating hormone
  - S/C injections studied in PD patients, found to stimulate food intake over 3\* and 7\*\* days
  - No adverse effects

\*Wynne K. et al. J Am Soc Nephrol. 2005;16:2111-2118

\*\*Ashby et al. Kidney Int. 2009; 76:199-206

2018 ASPN MULTIDISCIPLINARY SYMPOSIUM

## Enteral Nutrition Support

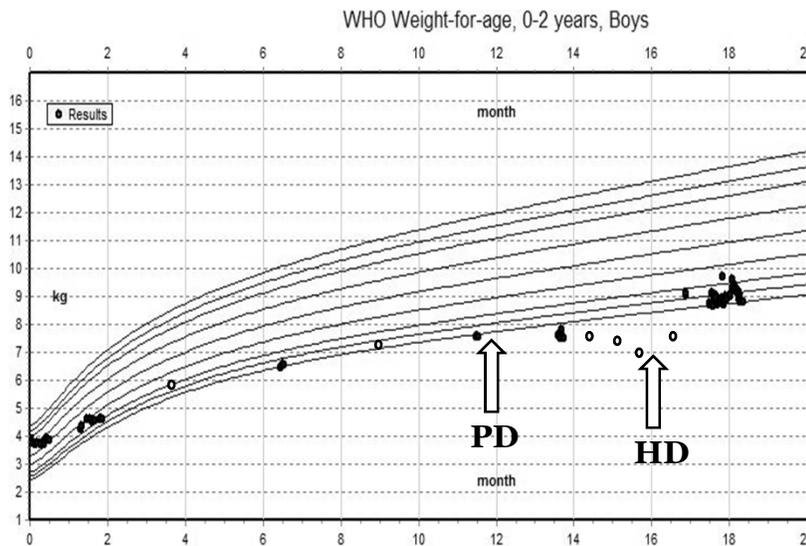

- Early intervention with enteral supplementation is the key\*

Route	Advantages	Disadvantages
NG	<ul style="list-style-type: none"> <li>• No surgical intervention</li> <li>• Easily removed</li> </ul>	<ul style="list-style-type: none"> <li>• Likely to be pulled out</li> <li>• Gagging, emesis, GER</li> <li>• Post-traumatic feeding disorder</li> </ul>
G-tube	<ul style="list-style-type: none"> <li>• Best choice for long-term</li> <li>• Flexibility to give bolus and/or overnight feeds</li> </ul>	<ul style="list-style-type: none"> <li>• Surgical placement</li> <li>• Risk of infection</li> <li>• Placing G-tube prior to PD catheter reduces infection risk**</li> </ul>
GJ tube	<ul style="list-style-type: none"> <li>• Bypasses stomach, ensures nutrition in those with vomiting</li> </ul>	<ul style="list-style-type: none"> <li>• Slow continuous rate</li> <li>• Difficult to replace</li> <li>• May still have retching</li> <li>• Certain medications can not be given</li> </ul>

## Change of Dialysis Modality

## Case 2- Anuric Child on HD

- 2 year old ESRD, sec to ARPKD, on chronic HD, MWF
- Anuric, s/p bilat. nephrectomies
- G-t dependent, refuses PO
- Fluid restriction 500 ml/day
- Caloric needs ~1120/day

## What will you do?

A.

- B. High caloric formula (70 kcal/oz to meet needs within fluid limit)
- C. Increase frequency of dialysis
- D. Aggressive PO feeding therapy
- E. Concentrated blenderized diet
- F. Change to PD

### What will you do?

- A. Do nothing
- B. High caloric formula (70 Kcal/Oz)
- C. Increase frequency of dialysis
- D. Aggressive po feeding therapy
- E. Concentrated blenderized diet
- F. Change to PD

### Case 3: BMD affecting Nutrition and Growth

The figure is a growth chart titled "Stature-for-age, 2 - 20 years, Girls". The x-axis represents age in years from 2 to 18. The y-axis represents height in centimeters (cm) from 75 to 190. The chart shows several percentile curves. A series of black dots represents the patient's "Results", which start at approximately 85 cm at age 2 and follow a lower trajectory than the percentile curves until age 10. At age 10, an arrow labeled "Transplant" points to the data. Following the transplant, the patient's height increases significantly, reaching approximately 145 cm by age 18, which is closer to the 50th percentile.

- ESRD sec. to ANCA+ GN at age 3 years
- Chronic HD from age 3 to 10
- Severe osteodystrophy
- Very poor growth, calcifications on HD
- Labs: Ca 11.0, Phosphorus 10.0, iPTH 3,200
- Improved growth post-transplant

## Calcifications in soft tissue and arteries

## What will you do?

- A. 
- B. Growth hormone
- C. Low phosph diet
- D. Increase calcium carbonate
- E. Change calcium carbonate to sevelamer
- F. Increase calcitriol dose
- G. Add Cinacalcet
- H. C, E and G

**What will you do?**

- A. Do nothing
- B. Growth hormone
- C. Low phos diet
- D. Increase calcium carbonate
- E. Change calcium carbonate to sevelamer
- F. Increase calcitriol dose
- G. Add Cinacalcet
- H. C, E and G

**Solutions: Bone Management for Growth\***

- Limit **phosphorus** intake to 80% of DRI when PTH and phosphorus levels elevated
- **Binders** (calcium vs. non-calcium)
  - Limit calcium intake to 2x DRI
- **25 hydroxy vitamin D**
  - $<30$  ng/mL- supplement to replete
  - Maintenance dose  $\geq 30$  ng/mL
- **Active vitamin D:** initiate when 25-hydroxy D  $>30$  and PTH above target
- **Cinacalcet-** more evidence needed

- 0.25 mg/kg shown to be safe starting dose in children on dialysis <6 years old

Pediatric Nephrology  
<https://doi.org/10.1007/s00467-018-4055-7>

ORIGINAL ARTICLE

**Cinacalcet as rescue therapy for refractory hyperparathyroidism in young children with advanced chronic kidney disease**

Aura J. Arenas Morales<sup>1</sup> · Marissa J. DeFreitas<sup>1</sup> · Chryso P. Katsoufis<sup>1</sup> · Wacharee Seeherunvong<sup>1</sup> · Jayanthi Chandar<sup>1</sup> · Gaston Zilleruelo<sup>1</sup> · Michael Freundlich<sup>1</sup> · Carolyn L. Abitbol<sup>1</sup>

Received: 15 February 2018 / Revised: 10 August 2018 / Accepted: 13 August 2018  
 © IPNA 2018

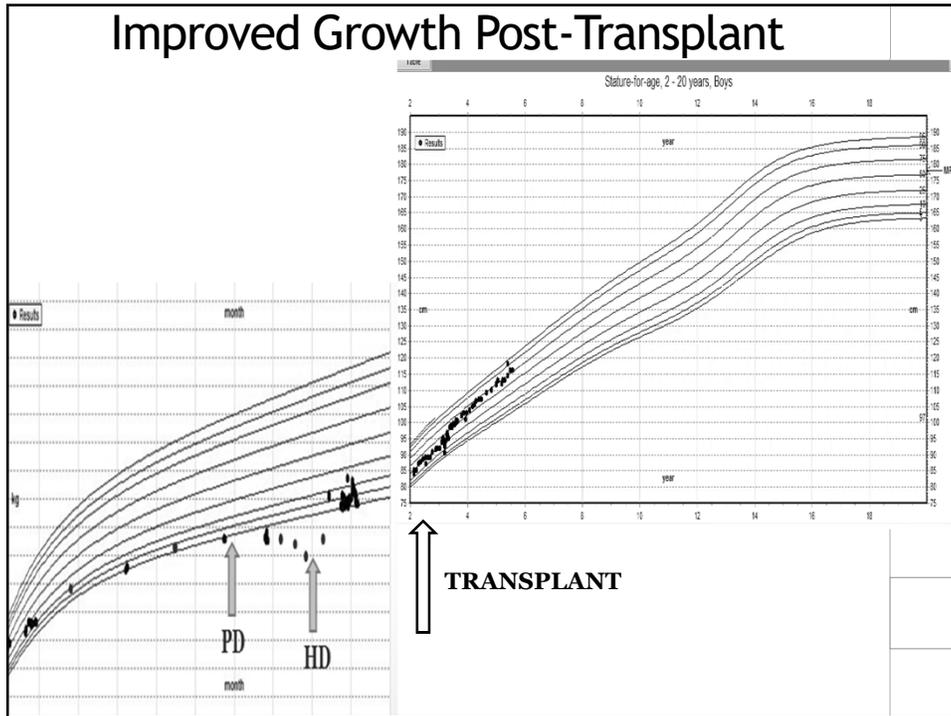

- Cinacalcet may be used effectively and safely in infants/small children with refractory sHPT in advanced CKD. Cinacalcet successfully brings iPTH to target level and supports growth when other treatments have been ineffective.

## Nutritional Challenges Post-Transplant

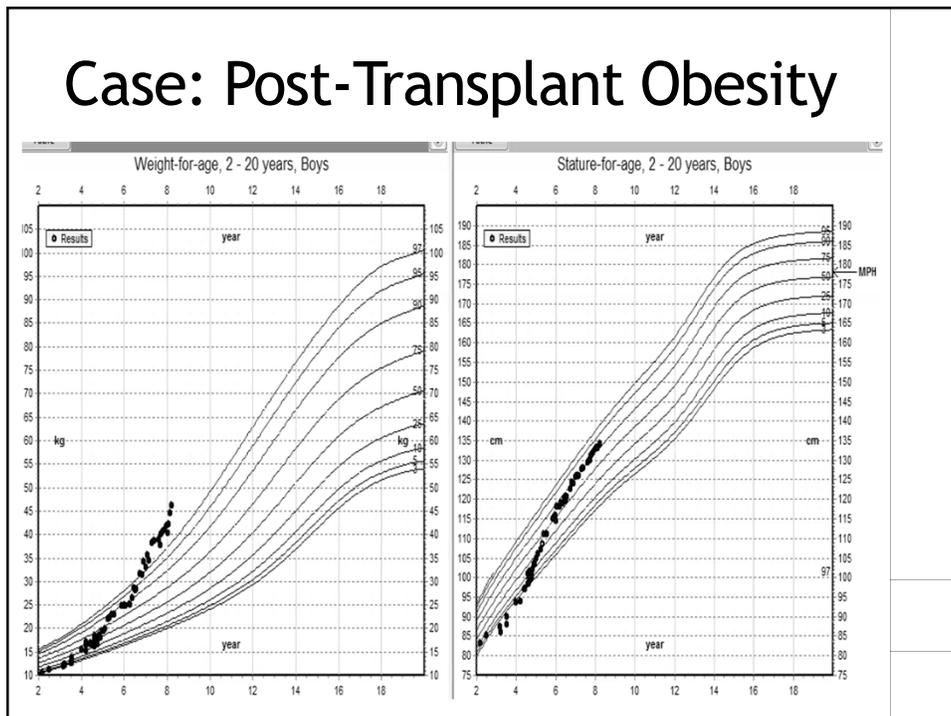

- Rapid weight gain and obesity
- Metabolic Syndrome
- NODAT
- Phosphorus and magnesium wasting
- Recurrent UTIs, diarrhea related to antibiotics, and alteration of microbiome → inflammation
- Failure to thrive

2018 ASPN MULTIDISCIPLINARY SYMPOSIUM

## Improved Growth Post-Transplant

## Case: Post-Transplant Obesity

## What will you do first?

- A. Diet & exercise counseling
- B. Depression screening/psychologist referral
- C. Weight loss drugs
- D. Bariatric surgery

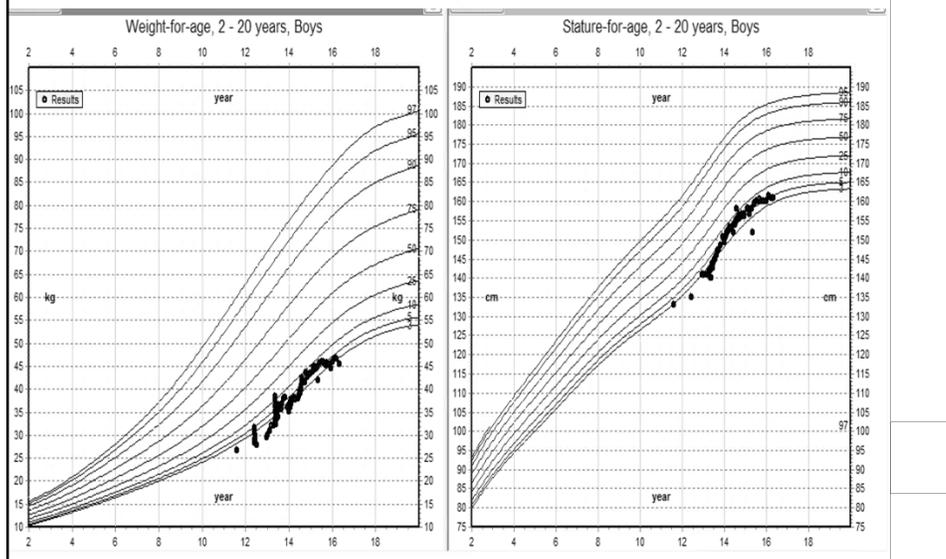

2018 ASPN MULTIDISCIPLINARY SYMPOSIUM

### What will you do first?

- A. Diet & exercise counseling
- B. Depression screen/psychologist referral
- C. Weight loss drugs
- D. Bariatric surgery

## Failure to Thrive Post-transplant

## Nutrition and Outcomes

Malnutrition negatively impacts patient outcomes:

- Increased morbidity/mortality
- Increased hospitalization
- Increased risk of infection
- Increased length of stay
- Increased healthcare cost
- Poor cognition
- Decreased quality of life

**Early Intervention is KEY!**

Mak R. *Curr Opin Support Palliat Care*. 2016 Dec;10(4):293-297

# Optimizing Nutrition

## CKD and ESRD

- Ensure adequate protein and caloric intake (GT may be needed)
- Adequate dialysis provision
- Control metabolic acidosis and ROD
- GH therapy

## Post-Transplant

- Screen and counsel for obesity and metabolic syndrome
- Screen and manage NODAT and lipidemia
- Phos, mag supplementation
- Bone health
- Bariatric surgery

- Vitamin D and other vitamins and micronutrient supplementation
- Promote aerobic and resistance building exercises.
- Screen and manage depression

## Conclusions- what we want to avoid:

**Born:** February 8, 1968  
**Died:** May 28, 2010  
**Height:** 4' 8" (1.42 m)
